# Diagram

# bmam()

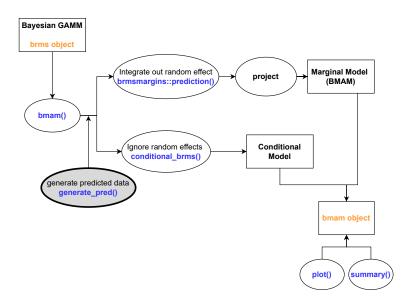

- Fit Bayesian Marginal Additive Model (BMAM)
- Modifying brmsmargins::marginalcoef function

Tianyi Pan R functions: BMAM 2022-05-31

## bmam()

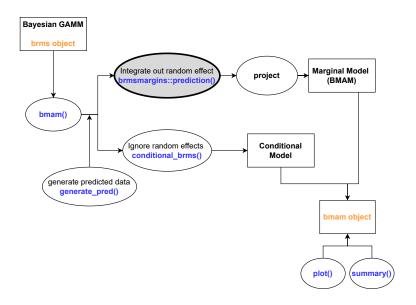

- object A fitted brms model object
- preddat A data frame containing covariates at which predictions are required
- length The number of observations in the generated preddat
- summarize Whether or not to calculate summaries of the posterior predictions
- posterior Whether or not to save and return the posterior samples
- backtrans The type of back transformation to be applied. default: response (use the response scale)
- centered Whether or not return centered smooths
- k The number of random draws in Monte Carlo method for integrating out the random effects

Tianyi Pan R functions: BMAM 2022-05-31

## generate\_pred()

```
## bmam()
  if (missingArg(preddat)) preddat <- generate_pred(object, length)</pre>
generate_pred <- function(object, length = 100){</pre>
  mf <- model.frame(object) # data in object
  ## smooth term
  smterm <- brmsterms(object$formula)$dpars$mu$sm # smooth term</pre>
  stopifnot(!is.null(smterm)) # check
  smvariable <- lapply(smterm[[2]][-1], function(term.) term.[[2]]) # varia</pre>
  sm_pred <- lapply(smvariable, function(var){</pre>
    x <- mf[[var]]
    x \leftarrow x[which(x!=0)] # remove 0
    x.max \leftarrow max(x)
    x.min \leftarrow min(x)
    seq(x.min, x.max, length = length)
  })
  names(sm_pred) <- smvariable</pre>
  sm_pred <- do.call("cbind.data.frame", sm_pred)</pre>
  ## fix effect
```

#### Integrate out random effect (brmsmargins::prediction)

Equation 4 in Hedeker's paper

$$\hat{\pi}_{ij}^{pa} = \int_{\boldsymbol{\theta}} g^{-1} \left( \boldsymbol{x}_{ij}' \hat{\boldsymbol{\beta}}^{ss} + \boldsymbol{z}_{ij}' \hat{\boldsymbol{T}} \boldsymbol{\theta}_{i} \right) dF(\boldsymbol{\theta}_{i})$$

For the  $h^{th}$  draw from posterior distribution,  $h=1,2,\cdots,H$  (H is the number of sampling, for example,  $4\times 1000$ )

- Calculate  $x\hat{\beta}^{ss,h}$ , and  $z\hat{T}^h$
- Generate K numbers from N(0, I), denoted as  $\theta^k$ ,  $k = 1, \dots, K$ .
- ullet Calculate  $g^{-1}\left(oldsymbol{x}_{ij}\hat{oldsymbol{eta}}^{ ext{ss},h}+oldsymbol{z}_{ij}\hat{oldsymbol{T}}^{h}oldsymbol{ heta}_{i}^{k}
  ight),k=1,\cdots,K$
- Average over k.  $\hat{\pi}_{ij}^{\textit{pa},h} = \sum_{k=1}^{\textit{K}} \textit{g}^{-1} \left( \textit{\textbf{x}}_{ij} \hat{\pmb{eta}}^{\textit{ss},h} + \textit{\textbf{z}}_{ij} \, \hat{\pmb{T}}^{h} \theta_{i}^{k} 
  ight) / \textit{K}$

```
mu <- brmsmargins::prediction(
  object, data = model.frame(object),
  summarize = FALSE, posterior = TRUE, effects = "integrateoutRE",
  backtrans = backtrans, k = k, raw = TRUE)</pre>
```

Tianyi Pan R functions: BMAM 2022-05-31

#### Projection

$$f^{\mathrm{M}}(\mathbf{X}) = \boldsymbol{B}^{\mathrm{M}} \boldsymbol{\alpha}^{\mathrm{M}}$$
 
$$\widehat{\boldsymbol{\alpha}}^{\mathrm{M}} = \operatorname{argmin} \left\| \widehat{\boldsymbol{\lambda}}^{\mathrm{M}} - \boldsymbol{B}^{\mathrm{M}} \boldsymbol{\alpha}^{\mathrm{M}} \right\| = \left( \boldsymbol{B}^{\mathrm{M}^{\top}} \boldsymbol{B}^{\mathrm{M}} \right)^{-1} \boldsymbol{B}^{\mathrm{M}^{\top}} \widehat{\boldsymbol{\lambda}}^{\mathrm{M}}.$$

#### 1. Design Matrix B<sup>M</sup>

Tianyi Pan R functions: BMAM 2022-05-31

### 1. Design Matrix $B^{M}$

```
## Xs: basis function for smooth term, without penalty (ncol = 1)
Xs_name <- data_names[grep(pattern = "Xs", data_names)]</pre>
Xs <- do.call(cbind, standata[Xs name])</pre>
## set names for Xs
Xs_name_list <- mapply(function(i,j)paste(j,seq_len(i),"alpha",sep="_"),</pre>
                        lapply(standata[Xs_name],ncol),
                        Xs name)
colnames(Xs) <- as.character(unlist(Xs name list))</pre>
## X: linear term, for example intercept + x1 + x2 + x1:x2
X <- standata$X
## design matrix
B <- cbind(X, Xs, Zs)
```

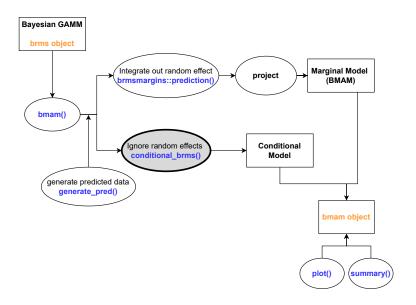

```
2. \widehat{\pmb{\lambda}}^{\mathrm{M}}
```

```
y <- links$fun(t(mu$Posterior))</pre>
```

#### 3. projection

```
beta <- lmcpp(B, y) # Cpp file from brmsmargins
                      # beta <- solve( t(B) %*% B ) %*% t(B) %*% y
prep <- prepare_predictions(object, newdata = preddat,</pre>
                              check_response = FALSE, re_formula = NA)
## Xs: basis function for smooth term, without penalty (ncol = 1)
pred_Xs <- prep$dpars$mu$sm$fe$Xs</pre>
## Zs: basis function for smooth term (ncol = k-2)
pred_Zs <- sapply(prep$dpars$mu$sm$re, function(re.)re.$Zs)</pre>
pred_Zs <- do.call(cbind, pred_Zs)</pre>
## X: linear term
pred_X <- prep$dpars$mu$fe$X</pre>
pred_B <- cbind(pred_X, pred_Xs, pred_Zs)</pre>
if(centered) pred_B <- sweep(pred_B,2,colMeans(pred_B),'-')
Predicted <- pred B %*% beta
```

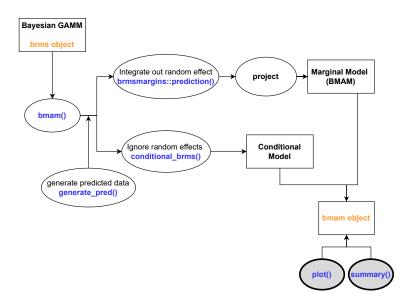

Tianyi Pan R functions: BMAM 2022-05-31

### bmam() Conditional Model

```
predict_conditional <- conditional_brms(object, preddat,</pre>
                                            centered = centered, ...)
conditional_brms <- function(object, data, centered = FALSE, ...){</pre>
  yhat <- fitted(</pre>
    object = object, newdata = data,
    re formula = NA, scale = "linear",
    summary=FALSE)
  if(centered){
    ones <- matrix(rep(1,ncol(yhat)))</pre>
    H matrix <- ones %*% solve(t(ones) %*% ones) %*% t(ones)</pre>
    M_matrix <- diag(1,ncol(yhat)) - H_matrix</pre>
    predicted <- M_matrix %*% t(yhat)</pre>
  }else{
    predicted <- t(yhat)</pre>
  as.data.table(do.call(rbind, apply(predicted, 1, bsummary, ...)))
}
```

Tianyi Pan R functions: BMAM 2022-05-31

# plot()

- object Objects of Class 'bmam'
- compared.model Other model (fitted before calling the function) compared with BMAM. Supported models: 1. mam 2. gam 3. brms gam
- display Whether or not to display the plots. Default: TRUE
- conditional Whether or not to plot the conditional model. Default: TRUE
- smooth.function True values of the smooth functions.

Tianyi Pan R functions: BMAM 2022-05-31

### summary()

```
print.bmam <- function(object,...){</pre>
  summary(object,...)
  invisible()
summary.bmam <- function(object, plot.smooth = FALSE, ...){</pre>
  ### 1. Marginal Model ###############
  ## smooth term: linear term
  ### 2. Conditional Model ###########
  ## smooth term: linear term
  out <- list(BMAM = BMAM, Conditional Model = Conditional Model)
  if(plot.smooth){
    gg <- plot(object, ...)
    out$plot <- gg
  invisible(out)
```

- object Objects of Class 'bmam'
- plot.smooth Whether or not to plot bmam
